

WORK

A curated index of things I've built.

Mostly AI-native tools, developer infrastructure, and data products — each shaped by the same question: how do we make a complex system feel simple to the people using it?

Text-to-SQL Assistant

A safe internal AI tool that lets leadership ask questions in plain language and get trustworthy answers from the data warehouse — no SQL required.

AI Infrastructure

2025

Conversational AI Orchestration Platform

A platform powering internal AI chatbots and workflow assistants, with shared tooling, evals, and routing across many use cases.

AI Infrastructure

2024

Incident Response Assistant

An AI assistant that helps on-call engineers investigate and respond to operational incidents by gathering context and suggesting next steps.

AI Developer Tooling

Internal tools and standards that improve developer velocity, code quality, and time-to-merge across engineering teams.

CASE STUDY

Text-to-SQL Assistant

THE PROBLEM

Leadership needed answers from the warehouse faster than the data team could turn around one-off queries, and self-serve dashboards never quite matched the question being asked.

THE APPROACH

Designed a constrained text-to-SQL pipeline: a curated semantic layer, schema-aware prompting, read-only execution, and a validation pass that explains every query in plain language before it runs.

THE RESULT

Self-serve data access with human-readable query previews, guardrails against unsafe operations, and a feedback loop that steadily improved accuracy on the questions people actually ask.

THE TECHNOLOGY

LLM orchestration

Postgres

Semantic layer

Guardrails

Next.js
